1 Purpose and Reader Navigation

This document is a compact starting point for scientific articles, reports, and course notes that should compile to a tagged PDF with LuaLaTeX. It demonstrates structural headings, mathematical notation, tables, vector diagrams, imported raster graphics, cross-references, and a references section.

An accessible scientific document should expose the same logical organization to assistive technology that sighted readers infer from layout. Use real section commands, captions, labels, alternative text, and meaningful link text rather than relying on visual styling alone.

1.1 Document Structure

The section hierarchy is intentionally regular: sections contain subsections, figures have captions, and references are cited in the surrounding prose. For example, Figure 1 gives a high-level authoring workflow, while Table 1 lists checks that are useful before sharing a PDF.

1.2 Accessible Scientific Claims

Scientific writing is easier to navigate when important claims are stated before technical details. A typical result paragraph might read as follows.

The error decreased monotonically for the tested step sizes, and the final residual was below the reporting threshold. The convergence pattern is consistent with the update rule in Equation (3).

2 Mathematics and Notation

2.1 Displayed Equations

Use LaTeX math environments rather than raw display delimiters. With the document metadata at the top of this file, the LaTeX tagging layer can attach MathML-oriented alternative representations where supported by the toolchain.

The fundamental theorem of calculus is a simple displayed equation:

$$\int_a^b f(x) dx = F(b) - F(a). \tag{1}$$

For a least-squares objective,

$$J(\theta) = \frac{1}{m} \sum_{i=1}^m (h_{\theta}(x_i) - y_i)^2, \tag{2}$$

one common iterative update is

$$\theta_{k+1} = \theta_k - \alpha \nabla J(\theta_k), \tag{3}$$

where $\alpha > 0$ is the learning rate.

2.2 Lists Near Equations

When a formula has several symbols, a short list can be clearer than a dense paragraph.

- m is the number of observations.
- $h_\theta(x_i)$ is the model prediction for observation i .
- y_i is the measured response.
- $\nabla J(\theta_k)$ is the gradient evaluated at iteration k .

3 Tables and Checklists

3.1 A Tagged Table

Table 1: Accessibility checks for a scientific PDF.

Check	Why it matters	Example in this file
Section hierarchy	Screen readers and PDF outlines use headings for navigation.	Sections and subsections are created with structural commands.
Figure descriptions	Visual information needs a text alternative.	Figures 1, 2, and 3 include alt text.
Captioned graphics	Captions support citation, review, and cross-reference workflows.	Every figure and table has a caption and label.
Machine-readable math	Mathematical expressions should be exposed beyond visual glyphs.	Equations (2) and (3) use equation environments.
References	Citations should be reachable from the prose and listed consistently.	The bibliography cites accessibility and PDF standards [1, 2].

4 Tagged Vector Figures

4.1 Workflow Diagram

The TikZ picture in Figure 1 uses the ‘alt’ key on the `tikzpicture` environment. The visual diagram remains available to sighted readers, while the tag structure receives a concise text description of the same content.

4.2 Plot-Style Figure with Redundant Encoding

Figure 2 uses both color and markers. This avoids encoding essential information by color alone, which is important for readers with color-vision deficiencies and for grayscale printing.

Figure 1: A workflow for producing an accessible scientific PDF.

Figure 2: A TikZ contour-style diagram with a gradient descent trajectory.

5 Tagged Raster Graphics

5.1 Importing a PNG

The PNG in Figure 3 is imported with `\includegraphics`. The important accessibility detail is the explicit `alt` option. For complex research figures, keep the caption short and put the full explanation in the surrounding prose or in the alternative text.

Figure 3: Imported PNG with explicit alternative text.

5.2 Writing Useful Alternative Text

Good alternative text should communicate the role of the figure in the argument. It usually does not need to list every visual detail.

1. Start with the figure type, such as “flow diagram,” “contour plot,” or “SVD reconstruction comparison.”
2. State the main pattern or conclusion.
3. Include labels, units, and trends when they are needed to understand the result.
4. Avoid phrases such as “image of” unless the medium is itself relevant.

6 Reproducibility Notes

6.1 Source and Output

For course notes and scientific reports, it is often useful to distribute the tagged PDF together with the source file and any external images. That lets readers audit equations, regenerate figures, and correct accessibility metadata without reverse-engineering the PDF.

6.2 Before Sharing

Before publishing, compile at least twice so the table of contents and cross-references settle. Then inspect the resulting PDF for reading order, document language, title metadata, bookmarks, figure descriptions, and meaningful link text. External validators can help, but they do not replace a manual review of whether the text alternatives are scientifically accurate.
